20 One-Liners to Remember

Quick-fire facts for last-minute revision.

1 BEP (Units) = Fixed Cost divided by Contribution per unit.

This is the standard formula for break even point expressed in number of units or loans.

2 BEP in sales value = Fixed Cost divided by the P/V Ratio.

This version is used when totals like total sales and total contribution are given instead of per-unit figures.

3 Contribution equals Selling Price minus Variable Cost.

Contribution is the amount left after variable cost that goes first to cover fixed cost and then to profit.

4 At the break even point, Total Revenue equals Total Cost and profit is exactly zero.

This is the core definition of BEP used throughout cost accounting and banking exams.

5 P/V Ratio = Contribution divided by Sales, often shown as a percentage.

The P/V ratio measures how efficiently sales convert into contribution and profit.

6 A higher contribution per unit lowers BEP, while higher fixed or variable cost raises it.

Contribution and cost move BEP in opposite directions, a key cause-effect relationship tested in exams.

7 Margin of Safety equals Actual Sales minus Break Even Sales.

Margin of safety shows how far sales can fall before the business starts making a loss.

8 Fixed costs such as staff salaries and branch rent stay constant regardless of business volume.

Fixed costs must be paid even if a bank branch does zero business in a period.

9 Variable costs such as loan processing and payment gateway charges rise and fall with business volume.

Variable costs move directly with the number of loans, transactions or accounts processed.

10 Profit above break even equals Total Contribution minus Fixed Cost.

Once fixed cost is fully recovered at BEP, every extra rupee of contribution becomes profit.

11 A higher P/V ratio means a lower break even point and stronger profitability per rupee of sales.

Since BEP equals Fixed Cost divided by P/V ratio, a larger ratio needs fewer sales to break even.

20 One-Liners | Break Even Point (BEP) Analysis in Banking: The Complete 2026 Guide fo

IIBF - Revision - Break Even Point (BEP) Analysis in Banking: The Complete 2026 Guide fo

-
- 12 The Angle of Incidence is formed where the total revenue line crosses the total cost line at BEP.**

A wider angle of incidence indicates a faster rate of profit growth once the break even point is crossed.

- 13 The Cash Break Even Point excludes non-cash fixed costs such as depreciation.**

Removing depreciation gives a lower, cash-only break even level useful for liquidity analysis.

- 14 Composite BEP for a bank with multiple products uses a weighted average contribution based on sales mix.**

Composite BEP reflects reality since a bank branch typically sells more than one product at once.

- 15 On a break even chart, the area below the intersection point is the loss zone and above it is the profit zone.**

The break even chart plots output on the X-axis and cost or revenue in rupees on the Y-axis.

- 16 Banks use BEP analysis to assess branch profitability, viability and expansion decisions.**

BEP tells management whether a branch is loss-making, merely sustainable, or genuinely profitable.

- 17 BEP analysis helps banks price loan interest rates, processing fees and service charges.**

Pricing decisions rely on BEP so that a product comfortably clears its break even level.

- 18 In credit appraisal, a borrower operating well above its own break even point is seen as a lower credit risk.**

Bankers assess a project or borrower BEP to judge how safely it can service and repay a loan.

- 19 Banks apply BEP analysis to judge cost recovery for digital products like mobile apps and fintech tie-ups.**

BEP helps management decide whether a new digital investment will pay back before committing large capital.

- 20 BEP is a recurring, scoring topic in IIBF JAIIB and CAIIB exams, tested via concepts, numericals and case studies.**

Its predictable pattern year after year makes it one of the easiest topics to prepare thoroughly.
